Lemma 2: Summit-based decomposition

Any feasible schedule σ which follows the (wED) rule is of the form $T_1 s_1 \dots s_k T_{k+1} s_{k+1} \dots s_N T_{N+1}$ where every job in sequence T_{k+1} is in set $\Pi_{s_k} \cup \Pi_{s_{k+1}}$.

- $2^{2q} \cdot (2q)!$ choices for sequence T_{k+1} .

- all jobs in sequence B_{k+1} are in $\Pi_{s_{k+1}} \setminus \Pi_{s_k}$ and scheduled by nondecreasing r_j .

Proposition [Erschler, Fontan, Merce 85]

On $1|r_j, d_j|C_{max}$ the summit-ordered schedules are dominant.

Lemma 1: Job order with summits

In any feasible schedule σ which follows the (wED) rule:

- (i) for all k in $[1, M]$ and $i \prec s_k$ we have $\sigma(i) < \sigma(s_k)$,
- (ii) for all k in $[1, M]$ and $j \succ s_k$ if $\sigma(j) < \sigma(s_k)$ then $j \in \Pi_{s_k}$.

Conclusion

Theorem [M., Hanen, Munier 24]

$1|prec, r_j, d_j|C_{max}$ can be solved in time:

$$\mathcal{O}(\max(1, q^2 \cdot 4^q) \cdot N + n^2)$$

where N is the number of summits ($\leq n$).

$$\mathcal{O}(\max(1, q^2 \cdot 4^q) \cdot N + n^2)$$

where N is the number of summits ($\leq n$).

Corollary: Maximum lateness

$1|prec, r_j|L_{max}$ can be solved in time:

$$\mathcal{O}(\max(1, q^2 \cdot 4^q) \cdot N \cdot \log(D) + n^2)$$

where N is the number of summits ($\leq n$) and $D = (\max_{j \in \mathcal{J}} r_j) + (\sum_{j \in \mathcal{J}} p_j)$.

Conclusion

Conclusion

- **New structural parameter** on single machine scheduling with job time windows.
- **FPT algorithm** on $1|prec, r_j, d_j|C_{max}$ derived from a **new dominance rule**.

Future work

- Consider other settings (like $P|prec, p_j = 1, r_j, d_j|C_{max}$).
- Refine the approach (bounds, heuristics).
